

List the three stages in which industries develop?

1. Scientific Feasibility
2. Engineering Feasibility
3. Economic Feasibility

Can you list any other examples, besides the airline industry, in which the government moved forward, once science and engineering feasibility had been proven, even though the costs were greater than the benefits?

The one example I can think of at the moment is space travel. Once NASA and other organizations like it had proved the scientific and engineering feasibility of space travel, the US government jumped right on the bandwagon despite the fact that it wasn't proven to be economically feasible at the time. Of course, the Russians getting their own satellites up into orbit had something to do with that too.
