

Jack's Nature Journal

1-6-09

Today, as yesterday, the sky is dark and filled with imposing stratus clouds. But what type of stratus clouds? We spotted stratocumulus and cirrostratus, along with just plain stratus clouds. There was, at the beginning of the walk, some blue sky at the very edge of the clouds, but that quickly closed up. We also felt quite a bit of wind, but when I went of get the wind speed, I got a grand total of 0 mph! I saw a flag waving about in the cemetery, but that was the only thing I saw moving in the wind. Funny. Anyway, the humidity is 28%, which is less than yesterday's reading in case you didn't remember that, the air pressure is 30.35 inHg and the temperatures are -2°C and 28°F.

We saw a very puffed up mockingbird, some juncos, a couple of very cute little downy woodpeckers, some tufted titmice and a bluejay, who was making a very funny noise.
