

Jack's Nature Journal
10-18-08

This morning, I looked out the window and saw a beautiful sunny day with a breeze blowing along, waving things on washing lines. I thought: "This is either going to be a really nice, warm day or it's going to be frigid." Then I went and looked at the thermometer and yep, it was frigid. The temperature was the lowest yet this fall, at 2°C and 35°F when I recorded it, but I'm sure it was lower than that when I looked out earlier. The wind was coming at 8 mph, which made it seem even colder. The air pressure was 20.25 inHg, and the humidity was 36%.

For my Keepers of the Animals project this morning, I looked up the answer to the question "Where do spiders make their webs?". Well, here is the answer, from Spiders and their Kin. Spiders make all sorts of webs in many different locations, but Orb Weavers and Funnel Weavers like to make their webs in more covered locations. But all spiders don't like to be in the open. So, as you can see, I would probably make a good spider!
