Okay, I can now say that it was even colder today than it was yesterday, at a shocking  $-1^{\circ}\text{C}$  and  $31^{\circ}\text{F}$ . But it feels even colder than that, because of the wind chill factor, which says that if you compare the wind speed and the temperature in Fahrenheit on a special chart, you get how cold it feels. And it feels really cold today, because the wind speed is 13.5 mph, which makes it feel like  $9^{\circ}\text{F}$ ! Ouch! Because it was so cold this morning, we bundled up with coats, hats, ski pants, scarves and gloves. We still felt cold in the wind!

This morning we didn't see any wildlife apart from a big turkey vulture that flew right overhead and some crows. But I did think about the answer to yesterday's question about spiders. For today, I have a new question about spiders, and it is "Which of the spiders you chose yesterday would be most likely to survive and reproduce?" If you remember from yesterday, the two types of spiders were orb weavers and funnel weavers. I have done a bit of research, and I have decided that they both do reasonably well but orb weavers are a bit more prolific than tunnel weavers, by what I've read and seen.
