

Scoured By Ice

Hypothesis: by Ashlei and Rachel.

That the ice and sand will act like sandpaper and shape and change the landscape.

Method:

We dipped ice cubes in the sand and rubbed it on the wood.

Result:

Our hypothesis was correct!! The ice and sand wore down the wood (landscape), just like sandpaper would.

Conclusion:

This experiment showed us how the glaciers shaped the landscape, and how tarns like Mountain Lake were formed.
